

Transform Your Transit Agency with On-Demand Microtransit Services

Overcoming Operational Challenges with Innovative Solutions

Imagine the pulse of a vibrant city, where the core is bustling with activity, but beyond its boundaries, quieter neighborhoods and remote areas often remain underserved by transit.

Transit agencies like yours face significant challenges in addressing these needs effectively while managing tight budgets, driver shortages, and operational constraints. Traditional fixed-route buses are costly to run in low-density areas, especially during off-peak hours or weekends, creating a persistent struggle to provide comprehensive service coverage.

In the face of changing demographics, where people are moving farther from city centers in search of affordable housing, and with flat or decreasing ridership numbers, agencies must find innovative ways to adapt.

The Power of On-Demand Microtransit

Enter on-demand microtransit – an innovative service designed to address these very challenges. Microtransit offers a cost-effective way to boost ridership while allowing you to test new routes without the financial risk associated with traditional expansion.

By leveraging real-time data, you can accurately gauge traffic patterns and determine which routes could be converted into fixed routes, ensuring that your service network grows in line with actual demand.

This flexible approach not only helps in widening service coverage but also enhances operational efficiency. By optimizing driver and fleet utilization, you can make the most out of your resources, providing better service to your community without incurring excessive costs.

For your riders, microtransit provides a level of convenience akin to a taxi, yet at the cost of a bus ride. This means greater access to affordable transportation and improved inclusion within the wider transit system.

Using a mobility app like Rides on Demand, riders will appreciate the ability to quickly book microtransit trips, track their ride in real-time, and receive timely updates on any changes or delays.

Microtransit Powered by Novus

The TripSpark Novus (or Trapeze PASS) back-office demand response solution is designed to integrate seamlessly with in-vehicle hardware, including MDTs and driver apps, in addition to rider-facing passenger information systems.

This integration ensures smooth, hassle-free operations, enabling you to manage services efficiently while providing a superior experience for both drivers and riders. With easy-to-use, yet comprehensive reporting capabilities, you'll have the insights to make informed decisions and optimize your service delivery.

For riders, our Rides on Demand app offers a streamlined experience – from quick trip bookings and real-time tracking of vehicles to effective communication with drivers and timely notifications about their journeys.

Discover the Future of Transit
